

Zomato Restaurant Analytics Dashboard – Project Documentation

This project is an interactive Excel Dashboard developed using the Zomato restaurant dataset. The dashboard focuses on restaurant performance, cuisine analysis, customer engagement, pricing trends, and online delivery insights.

1. Project Objective

The objective of this project is to transform raw Zomato restaurant data into meaningful business insights using Microsoft Excel dashboards. The dashboards help analyze restaurant ratings, customer votes, pricing distribution, cuisine popularity, and online delivery services.

2. Dataset Columns Used

- RestaurantID
- RestaurantName
- Country
- City
- Cuisines
- Rating
- Votes
- Average_Cost_for_two
- Price_range
- Has_Table_booking
- Has_Online_delivery
- Latitude
- Longitude
- Date
- Year
- Month
- Quarter

3. Data Cleaning & Transformation Techniques

- Removed duplicate records from the dataset.
- Handled blank and missing values using filtering and cleaning methods.
- Standardized text using Excel functions like TRIM(), PROPER(), and UPPER().
- Created new calculated columns such as Monthname, Quarter, and Price Buckets.
- Converted date columns into proper Excel date format.
- Categorized restaurant pricing into custom buckets for better analysis.
- Created Pivot Tables for backend calculations and dashboard visuals.

- Added interactive slicers for Country, City, and Year filtering.

4. Dashboard 1 – Executive Overview

This dashboard provides high-level insights into restaurant operations and customer engagement.

- Total Restaurants
- Average Rating
- Total Votes
- Average Cost for Two
- Table Booking Analysis
- Online Delivery Analysis
- Top 10 Cuisines by Votes
- Restaurants by Price Range
- Top Restaurants by Votes
- Monthly Votes Trend
- Geographic Analysis Map

5. Dashboard 2 – Detailed Insights

This dashboard focuses on advanced business insights, pricing analysis, customer behavior, and cuisine performance.

- Highest Rating KPI
- Most Expensive Cuisine KPI
- City with Highest Votes KPI
- Online Delivery Percentage KPI
- Cuisine vs Average Rating
- Cuisine vs Average Cost
- Top Cities by Restaurant Count
- Online Delivery vs Ratings
- Price Bucket Analysis
- Cost vs Rating Scatter Plot

6. Key Business Insights

- Restaurants providing online delivery tend to receive better customer ratings.
- North Indian cuisine received the highest customer engagement based on votes.
- Most restaurants belong to affordable and mid-range pricing categories.
- Metro cities have significantly higher restaurant concentration and customer activity.
- Higher pricing does not always guarantee better customer ratings.
- Certain restaurant chains dominate customer engagement across multiple cities.

7. Business Recommendations

- Restaurants should expand online delivery services to improve engagement.
- Budget and mid-range restaurants should be prioritized due to high demand.

- Restaurants with high prices but low ratings should improve customer experience.
- Popular cuisines can be promoted more aggressively in underperforming regions.
- Customer feedback analysis can further improve restaurant service quality.

8. Challenges Faced During Development

- Handling multiple cuisines stored in a single column.
- Managing duplicate restaurant names and inconsistent data.
- Creating scatter plots outside Pivot Charts due to Excel limitations.
- Designing a professional dashboard layout with interactive slicers.

9. Skills Demonstrated

- Microsoft Excel
- Pivot Tables & Pivot Charts
- Data Cleaning
- Dashboard Design
- Business Intelligence
- Data Visualization
- Analytical Thinking
- Interactive Reporting

10. Conclusion

This project helped strengthen practical Excel dashboarding skills and business analysis capabilities. The dashboards convert raw restaurant data into actionable business insights through interactive visualizations and analytical reporting.
